UM Connect+ campus commerce proposal

A connected campus approach to discovery cashless participation and programme oversight

28 October 2026

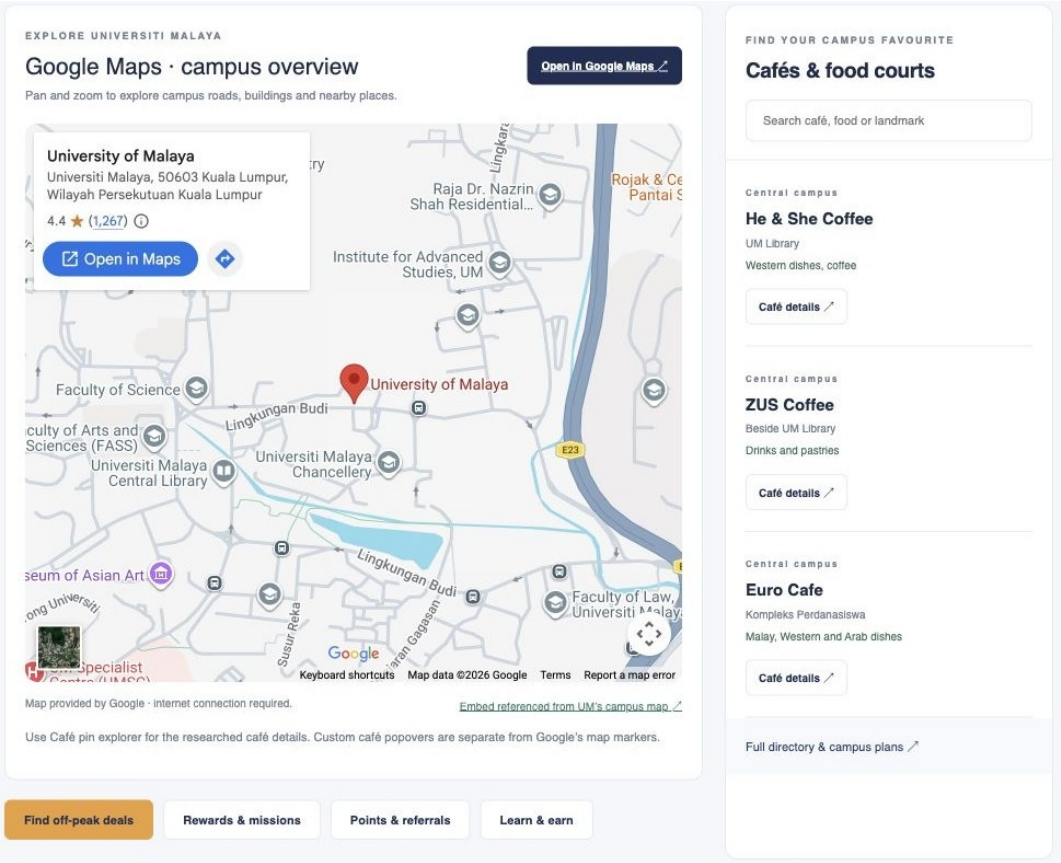

Figure 1 The student campus overview combines Google Maps with a searchable dining directory.

UM Connect+ proposes a coordinated programme in which students discover campus businesses, merchants receive readiness and promotion support, and MPP oversees participation and incentives. The platform connects these roles through a student progressive web app and merchant and MPP websites.

The proposal seeks endorsement to develop a bounded pilot, with named ownership, validated records and funded incentive terms agreed before live participation. Screens illustrate the current demonstrator; displayed figures are not measured programme results.

Executive proposal

The proposition

UM Connect+ brings campus commerce into a common discovery and participation process. It combines geographic visibility, preliminary knowledge and readiness assessment, merchant onboarding, participation incentives and programme oversight. The intended outcome is repeat cashless participation that can be evaluated for usefulness, inclusion and affordability.

Why the initiative warrants consideration

The proposed value extends beyond launching an app. Students gain clearer choices and reasons to return; merchants gain a structured route to readiness and targeted promotions; MPP gains consistent review and reporting responsibilities. The shared process creates a basis for testing whether these interventions produce additional qualified visits and useful learning.

The decision sought

Endorse a defined pilot scope and appoint a programme sponsor and operating owner. Authorise detailed validation of the business, data and reward model. Live activation would follow a further readiness decision covering identity, purchase evidence, funding, support and evaluation. This proposal does not commit an unapproved budget or establish external partnerships.

Proposal area	Scope in this document	Pages
Strategic case	Objectives, roles, operating model and delivery approach	2 to 6
Student value	Discovery, literacy, points, rewards and community	7 to 15
Merchant value	Readiness, promotions, spare capacity and entrepreneurship	16 to 21
MPP oversight	Segments, verification, approvals, budgets and reporting	22 to 27
Delivery decision	Incentive model, data, pilot evaluation and approval	28 to 33

Programme rationale and intended outcomes

A connected operating process

Information about campus businesses, QR readiness, incentives and participation can be fragmented. UM Connect+ proposes a single process around these activities, supported by distinct interfaces for each stakeholder. The programme hypothesis is that easier discovery and appropriate support, combined with relevant incentives, can encourage useful repeat visits.

Discovery and inclusion

A map-based campus view and publicly sourced café directory make locations and food information easier to compare. A preliminary survey separates financial knowledge from confidence with digital tools, allowing support to be considered for less confident students and merchants. Self-service and ambassador assistance are complementary access routes.

Repeat participation and learning

Points, referrals, short lessons and approved merchant promotions provide different reasons to return. Spending visibility connects the incentive experience with reflection on everyday expenditure. Off-peak offers focus attention on spare café capacity, with defined conditions rather than an unrestricted reward for every visit.

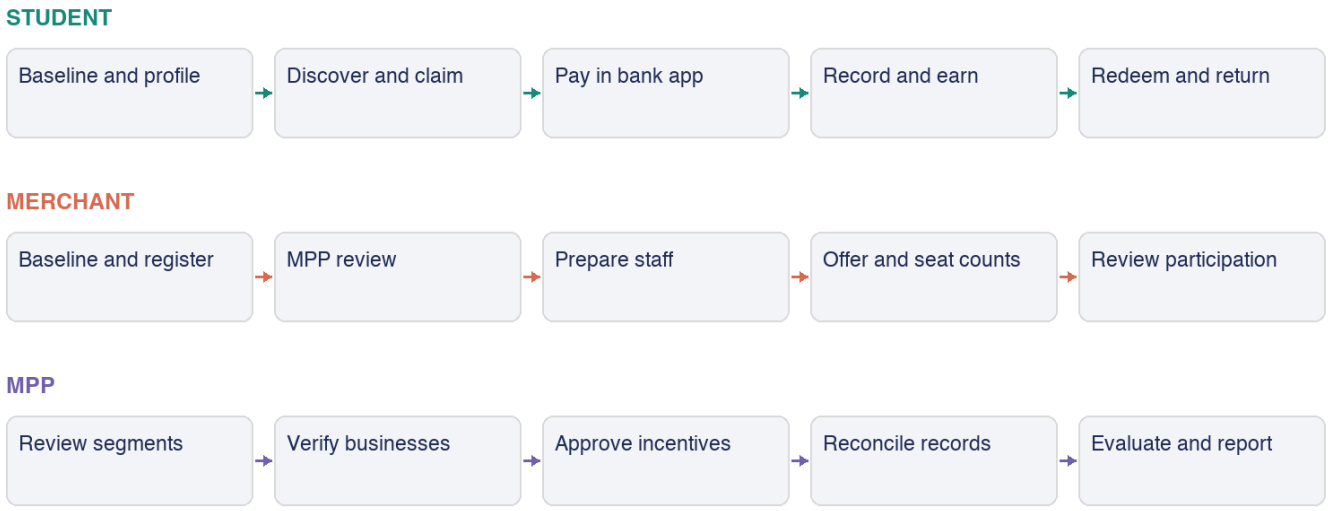

Programme accountability

MPP coordination brings merchant review, offer approval, reward configuration, exceptions and exports into an explicit operating model. The platform should make responsibility visible and support evidence-based decisions about continuation or expansion.

Intended outcome	Evidence a pilot should establish
More useful discovery	Participants find relevant venues and understand the information available.
Repeat qualified visits	First-time participants return beyond the activity that would occur without the programme.
Better readiness and knowledge	Validated assessments show learning or operational improvement.
Sustainable incentives	Reward cost, liability, exceptions and merchant effort remain acceptable.

How the system connects the three roles

The proposed operating cycle begins with readiness and business information, then moves through discovery, external payment, recorded participation and review. Students and merchants supply activity; MPP provides programme coordination and approval.

Operating model Student merchant and MPP responsibilities across the participation cycle

Merchant to MPP

Business submissions enter a verification process. Merchant promotions require approval, with standard campaigns and conditional off-peak offers treated as distinct types of proposal. A readiness assessment informs support but does not replace verification.

Merchant to student

Discovery information and approved offers connect students with relevant businesses. Offer availability depends on its approved terms and current eligibility. A claim signals intent to participate; it does not reserve a table or guarantee a bonus if conditions change.

Student to programme review

Payment takes place in an existing bank or e-wallet app. A separate participation record supports the proposed reward and reporting process. Reconciliation and evaluation close the loop by examining evidence, cost and outcomes before further participation or expansion.

The current demonstrator shares changes within one browser. A live operating model requires authenticated users and durable shared records.

Stakeholder roles and programme value

Stakeholder	Role in the proposed programme	Intended benefit
Students	Supply baseline information, discover venues, pay externally and record participation.	Clearer choices, reward visibility, learning and spending awareness.
Merchants	Maintain accurate business information, prepare staff, propose offers and honour approved terms.	Readiness support, campus visibility and a route to repeat or quieter-hour visits.
MPP	Coordinate support, verification, incentives, reconciliation, reporting and evaluation.	Consistent operating responsibilities and visibility into programme quality and cost.
Ambassadors	Assist merchants that require help with onboarding and explanation.	An inclusive route for businesses with different starting capabilities.

Distinct responsibilities at the point of payment

The student pays through an existing payment provider. The merchant independently confirms receipt through its own banking app. MPP oversees the programme record and any exceptions. A customer screenshot, readiness badge or programme check-in must not be treated as bank confirmation.

Decision rights

The proposed sponsor authorises scope and funding; the operating owner is accountable for programme delivery; MPP reviewers coordinate business and incentive decisions within agreed authority. Data stewardship, reward reconciliation, directory maintenance and support need identifiable owners before activation. These assignments remain subject to governance agreement.

Access model

Students use a dedicated PWA or browser experience. Merchants use the website. MPP has a separate web dashboard. The demonstrator separates these experiences for presentation, but secure accounts and permissions have not yet been implemented.

A student app with web based administration

Figure 2 The student app presents optional home screen access alongside the campus experience.

Student PWA

The student progressive web app supports convenient return access from a home-screen icon on supported devices, while remaining usable through a normal browser. The same features remain available: discovery, surveys, deals, points, spending, learning and community participation. Installation is optional and does not require an app-store release.

Merchant and MPP websites

Merchant operations and the separate MPP dashboard remain browser-based. This suits business submissions, review queues, programme configuration and reporting. The student app links to the MPP website separately; its cache worker does not install or cache that dashboard.

Connectivity and continuity

After an online load, cached student assets and bundled directory information can reopen offline. Google Maps, external pages and remote photos require connectivity. Records remain browser-local in the current demonstrator; installation does not introduce shared accounts, payment verification or cross-device synchronisation.

Delivery implication. The PWA reduces access friction, but a production programme still depends on reliable shared services and target-device testing. Physical phone installation has not yet been verified.

Students gain a clearer campus starting point

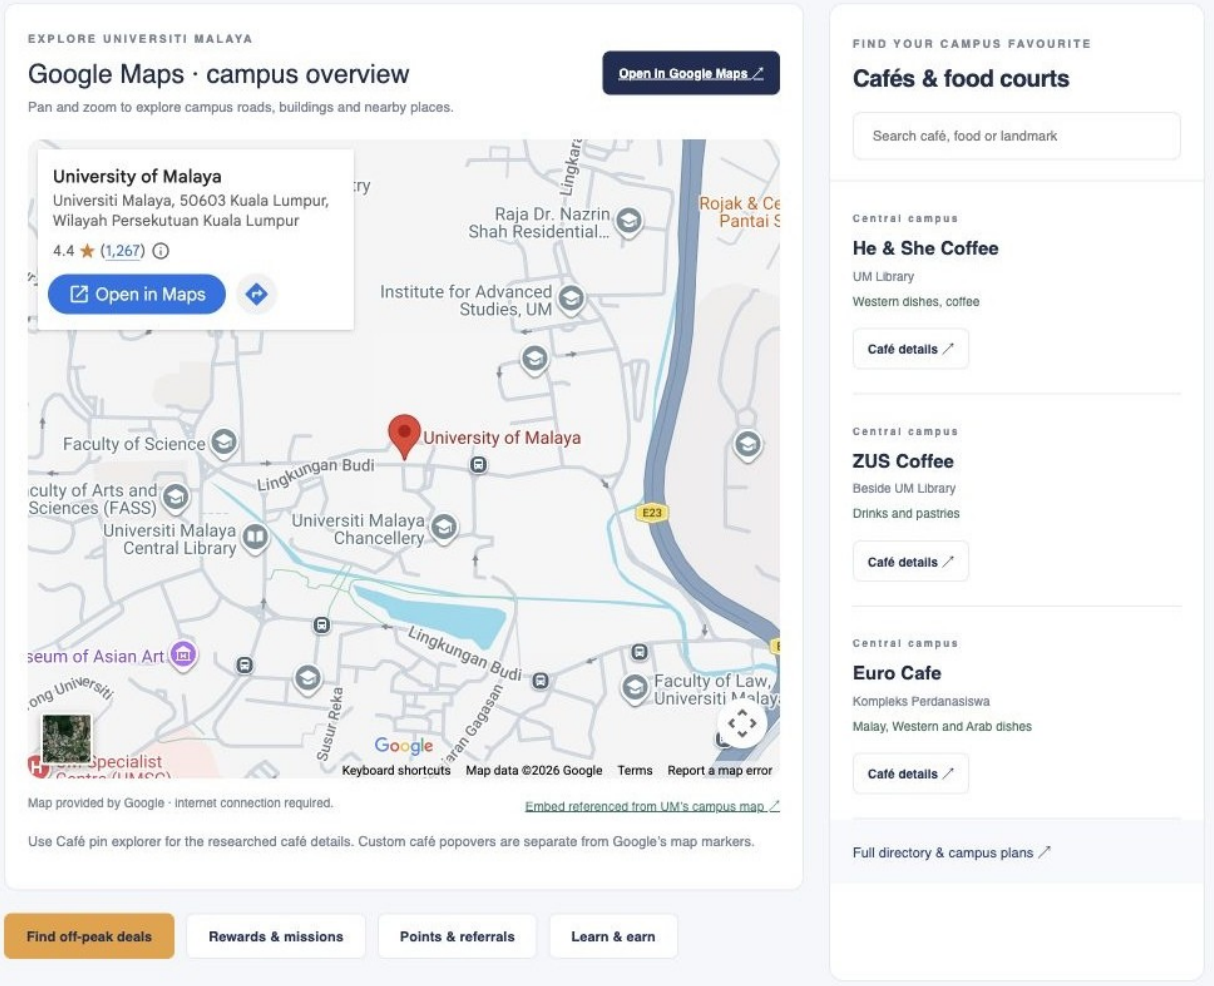

Figure 3 A larger view of the Google Maps campus overview and dining directory.

The student Overview combines geographic context with searchable café information and participation shortcuts. The map helps orient the student around campus, while the directory provides a structured route to location and food details. The experience connects browsing with relevant next actions such as a baseline assessment, off-peak offers or a post-payment record.

Intended value. Students spend less effort locating relevant information and can return to a familiar entry point. Public directory inclusion does not establish that a venue is currently trading, enrolled in the reward programme or offering an incentive.

Campus discovery and café information

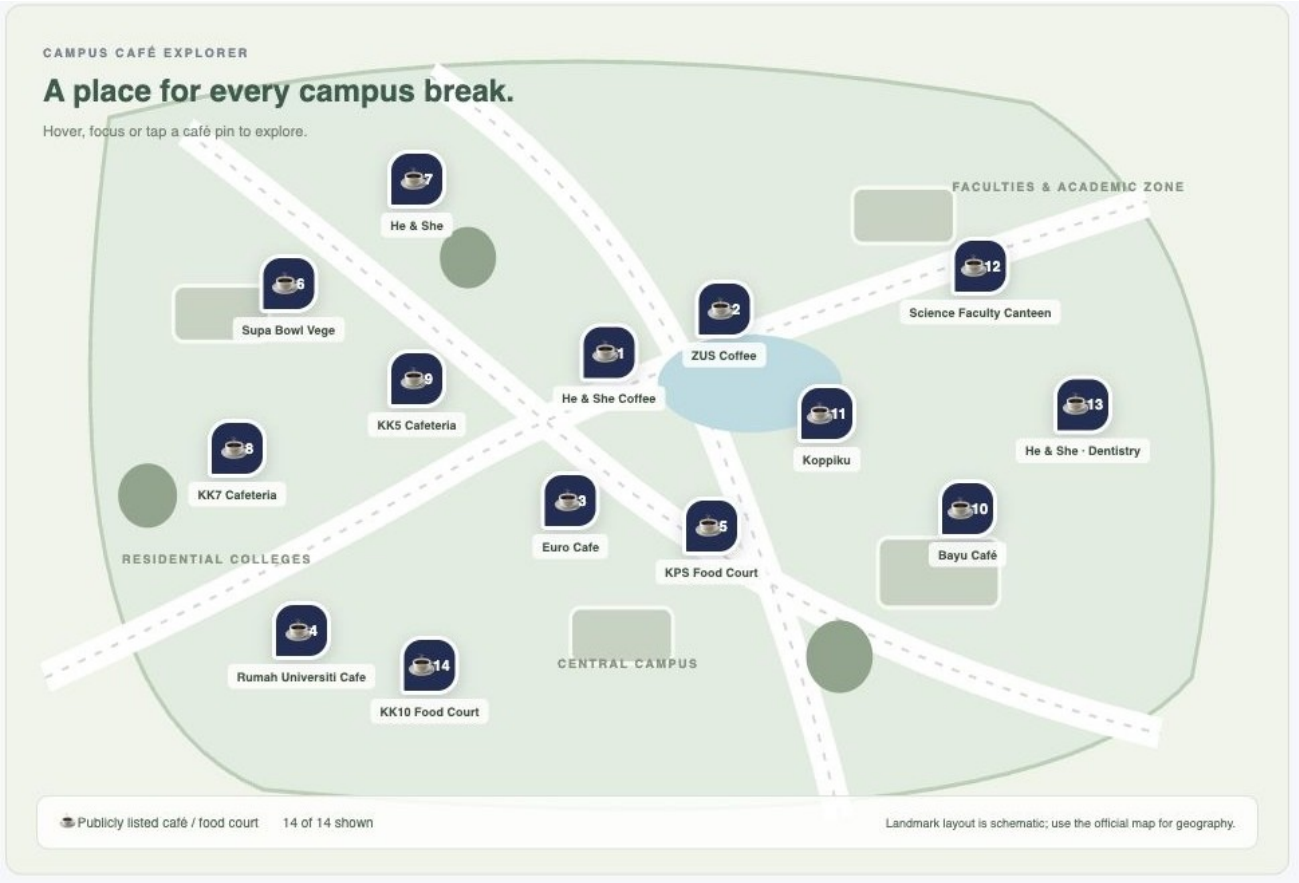

Figure 4 The separate café explorer presents fourteen publicly listed campus dining locations.

The discovery model combines Google Maps, a separate café pin explorer and the official campus plan. Search and zone filtering help visitors compare options across residential colleges, central campus, academic locations and the campus edge. Detail cards present food categories, landmarks, source links, price fields and hours where available.

Google supplies the geographic overview and its own place markers. Application café details open from the adjacent directory or the separate schematic explorer. Custom application hover pins directly on Google Maps have been deferred.

Information quality. Current prices are not published in the source records and hours require venue confirmation. The explorer positions are schematic. A pilot should replace these discovery references with an owned and regularly verified directory; public listings do not imply merchant participation.

A baseline for knowledge and readiness

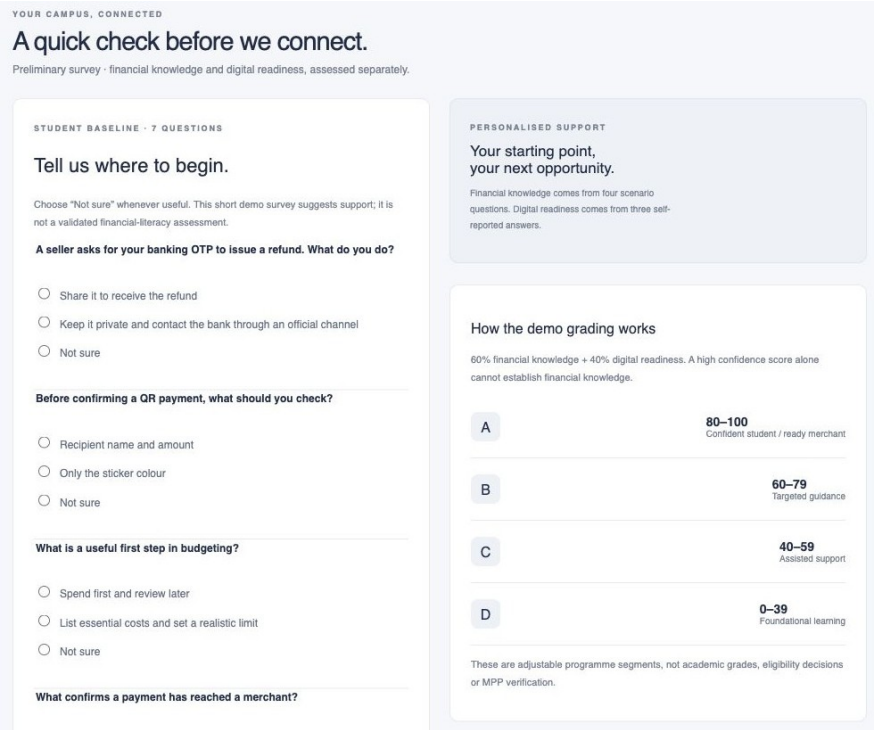

Figure 5 The preliminary baseline separates financial knowledge from digital confidence.

Seven questions provide an initial support profile. Four scenario questions cover payment safety, recipient and amount checks, budgeting and merchant confirmation. Three role-specific self-reports address digital or operational readiness. A combined score weights knowledge at 60 percent and readiness at 40 percent; the underlying scores remain visible.

Segment	Combined score	Proposed support interpretation
A	80 to 100	Confident student or ready merchant
B	60 to 79	Targeted guidance
C	40 to 59	Assisted support
D	0 to 39	Foundational learning

The first student completion earns the configured example reward regardless of grade. These segments are a preliminary demonstration rubric, not a validated assessment, academic grade or merchant verification. Governance validation should establish whether the questions and support pathways are appropriate for the pilot population.

External payment and recorded participation

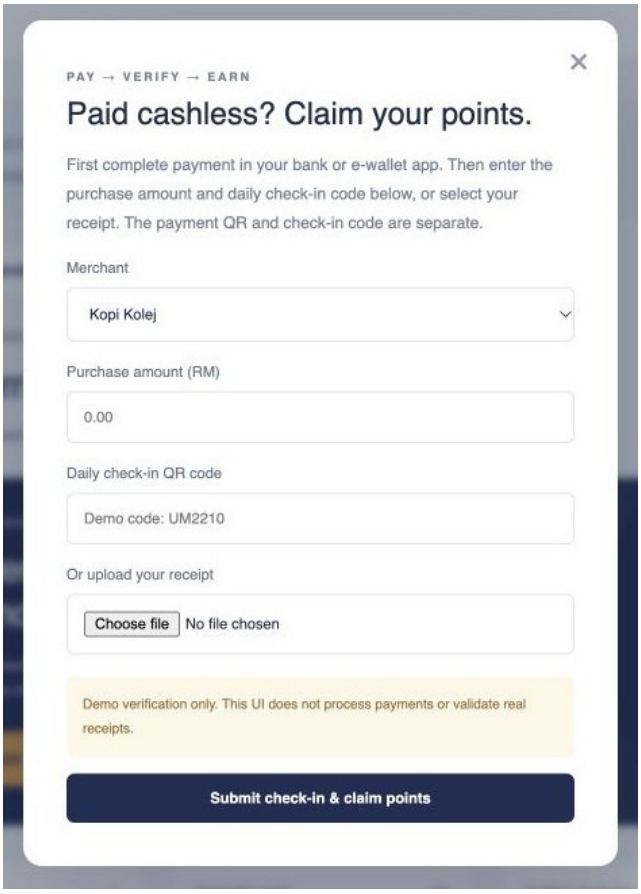

Figure 6 A participation record is separate from payment in a bank or e-wallet app.

Merchant discovery covers sample food, laundry, printing and shop businesses. A selected merchant explains the proposed sequence from external payment to a separate check-in and reward event. The participation form records a merchant and amount, then updates local points, spending, check-in count and recent activity.

The demonstrator accepts a typed example code or receipt selection. It does not process payment, read receipt contents, retain evidence, scan a signed camera QR or obtain bank confirmation. A production programme needs an agreed qualification process and reliable evidence before participation can support funded incentives or verified purchase claims.

Points and referrals create return incentives

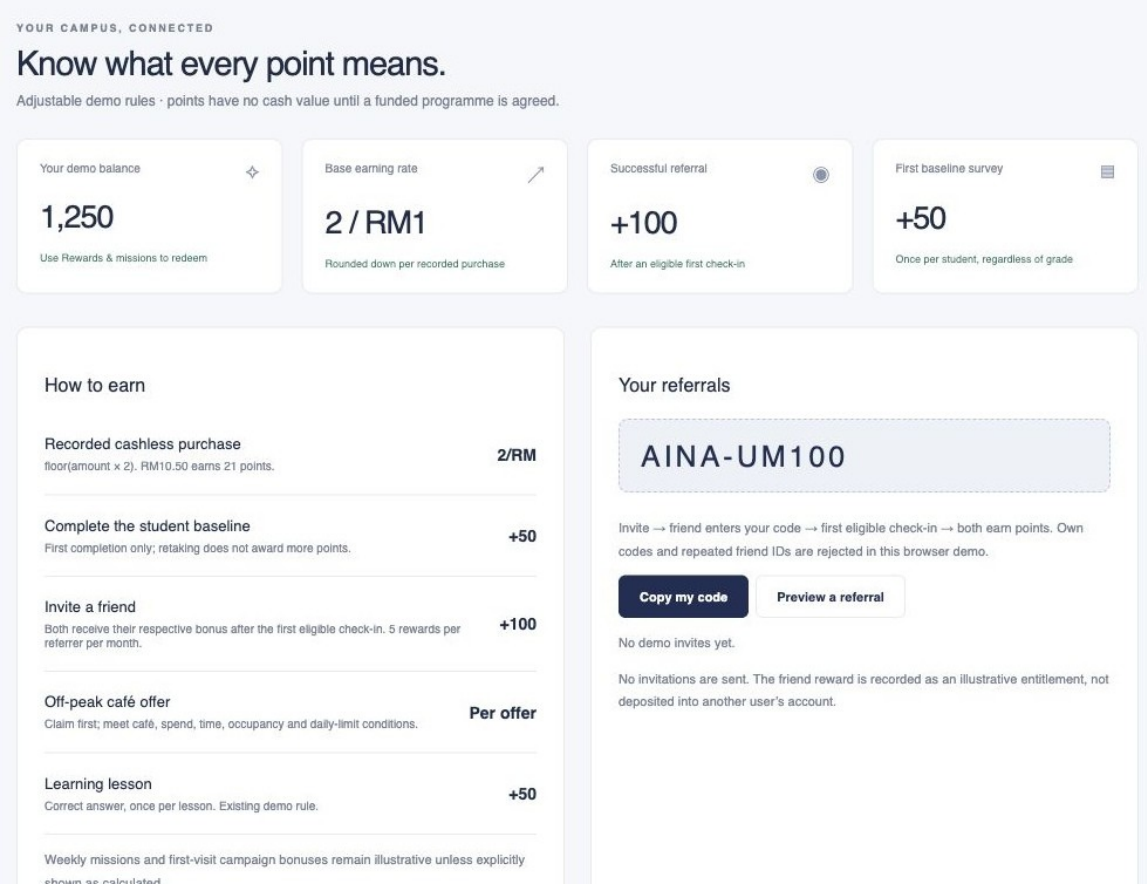

Figure 7 The points screen makes earning rules and referral status visible.

The proposed scheme combines purchase-linked base points with distinct baseline, lesson, referral and off-peak rewards. The current defaults include two points per RM, a 50-point first student baseline reward and 100 points each for a qualified referrer and invited friend. MPP can change specified future earning rates.

Referral qualification is tied to a first eligible participation event rather than code sharing alone. A monthly cap limits rewarded referrals; the demonstration defaults to five. Referrals remain simulated locally, with no invitation delivery, server-validated code ownership or payment into another user account.

Governance significance. Visible qualification and one-time awards make the incentive proposition easier to explain. A live scheme needs verified participants, shared cap enforcement, anti-abuse controls and an auditable reward ledger.

Rewards and missions support repeat visits

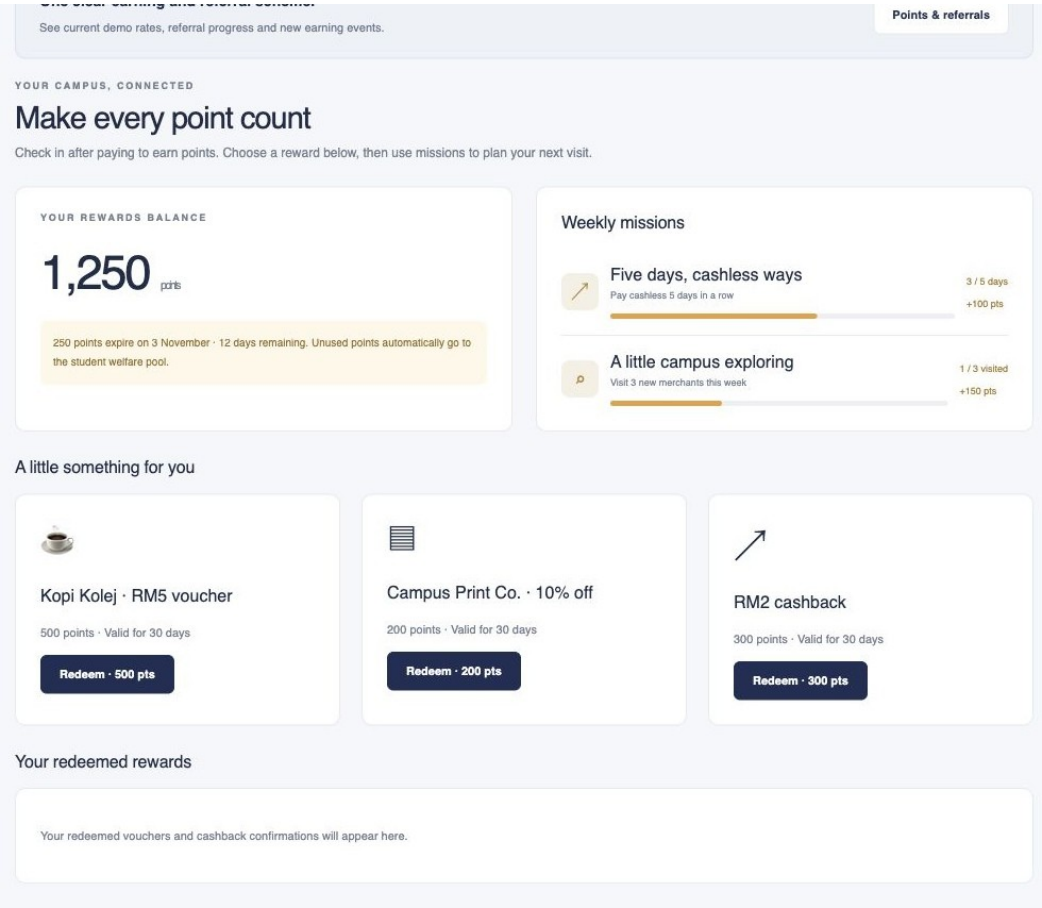

Figure 8 Example rewards and weekly missions show the proposed return experience.

Rewards translate a visible point balance into a proposed benefit. The demonstrator deducts a point cost and displays an example voucher. Current examples include a café voucher, a print discount and a cashback placeholder. Weekly missions illustrate repeated participation through consecutive cashless days and visits to new merchants.

The intended value is a reason to revisit and explore campus businesses beyond one transaction. Actual reward choice, cost, validity and merchant obligations should reflect funded terms and student needs. The current examples have no monetary entitlement; redemption is a local state change rather than fulfilled value.

Mission progression, standard first-visit multipliers, automatic expiry and expiry-to-welfare conversion remain illustrative. Programme approval would need to define the rules, liabilities, fulfilment and treatment of unused points before these promises can be made to participants.

Spending awareness complements incentives

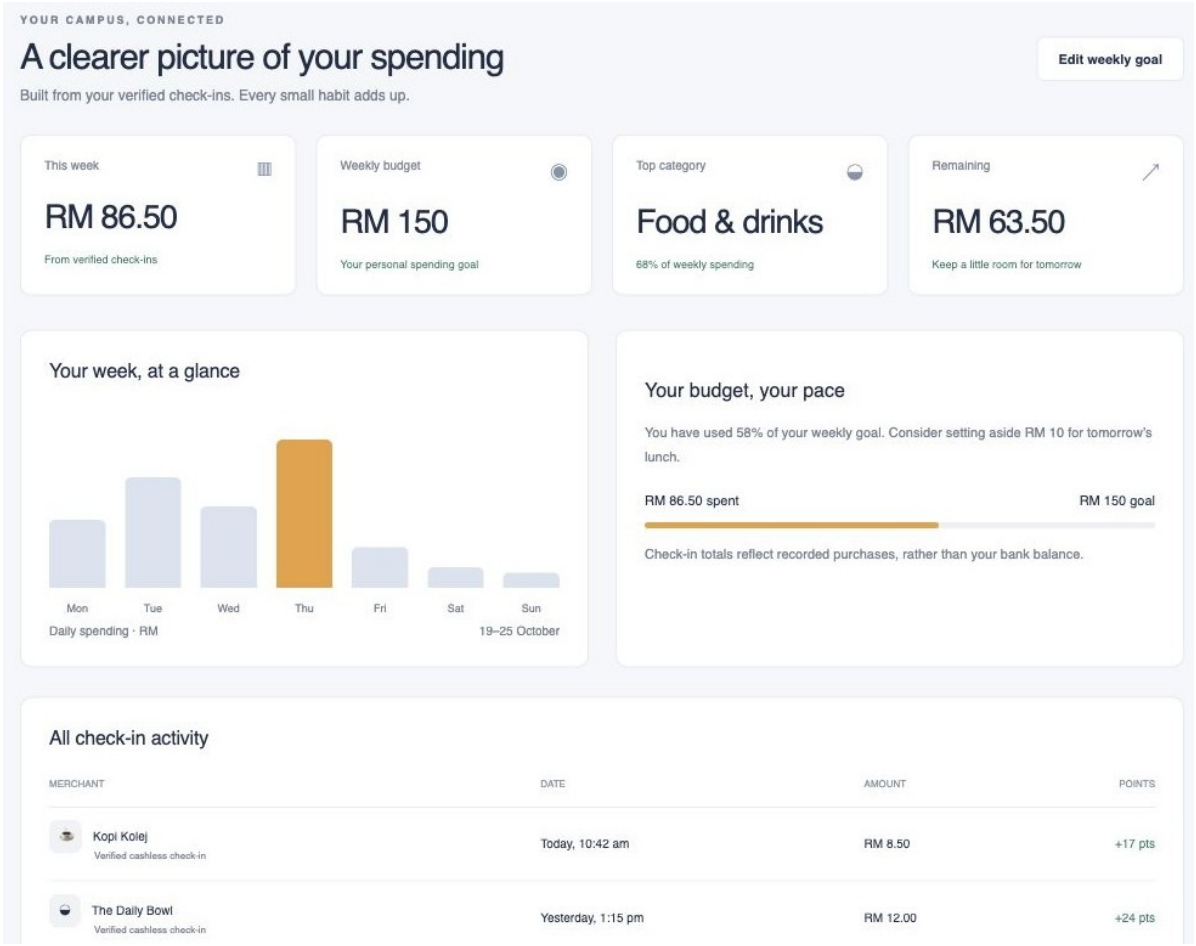

Figure 9 Recorded purchases are compared with a personal weekly spending goal.

The spending area places reward participation alongside a personal budget perspective. Recorded purchases contribute to a total, which is compared with an editable weekly goal to show the amount remaining and share used. Recent check-in activity provides a record of entered purchases.

The intended benefit is reflection on everyday expenditure rather than encouragement to spend solely for rewards. A programme evaluation should consider whether incentives support useful choices and awareness, including for students with limited discretionary spending.

The demonstrator does not connect to bank balances, import complete purchase histories or reset the budget week automatically. The chart and category share are sample values, so recorded totals should not be presented as a comprehensive picture of a student's finances.

Financial learning within the campus experience

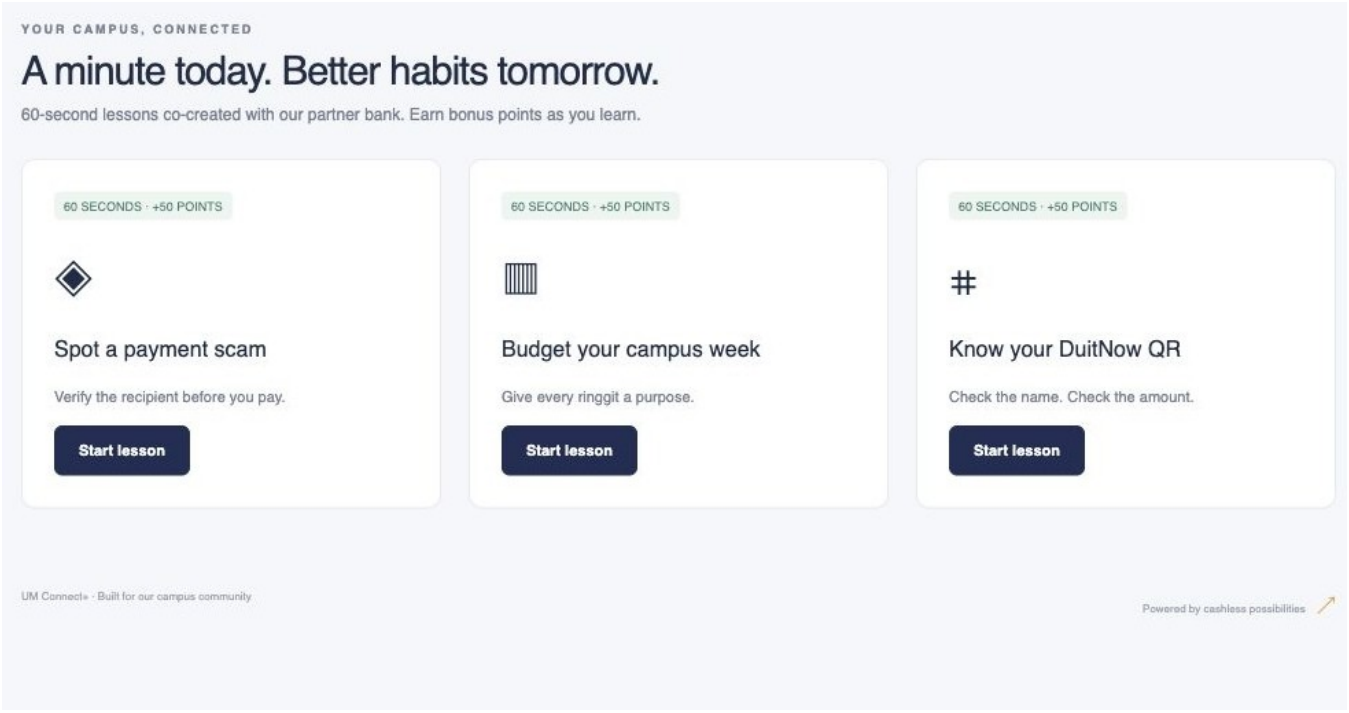

Figure 10 Short lessons connect cashless participation with payment safety and budgeting.

Learn & earn presents concise activities on payment scams, weekly budgeting and DuitNow QR checks. A first correct completion awards 50 demonstration points per lesson, while an incorrect response permits a retry. Completion persists in the current browser.

Locating learning within the discovery and participation experience offers a practical place for relevant reminders. The preliminary survey can direct students with lower knowledge scores toward these activities, allowing support to follow an expressed need rather than treating digital confidence as financial literacy.

The proposal should be evaluated through validated learning measures rather than completion counts alone. Any partner-bank wording in the interface describes a proposed content model and does not establish a confirmed partnership, accredited programme or endorsed curriculum.

Community participation and campus identity

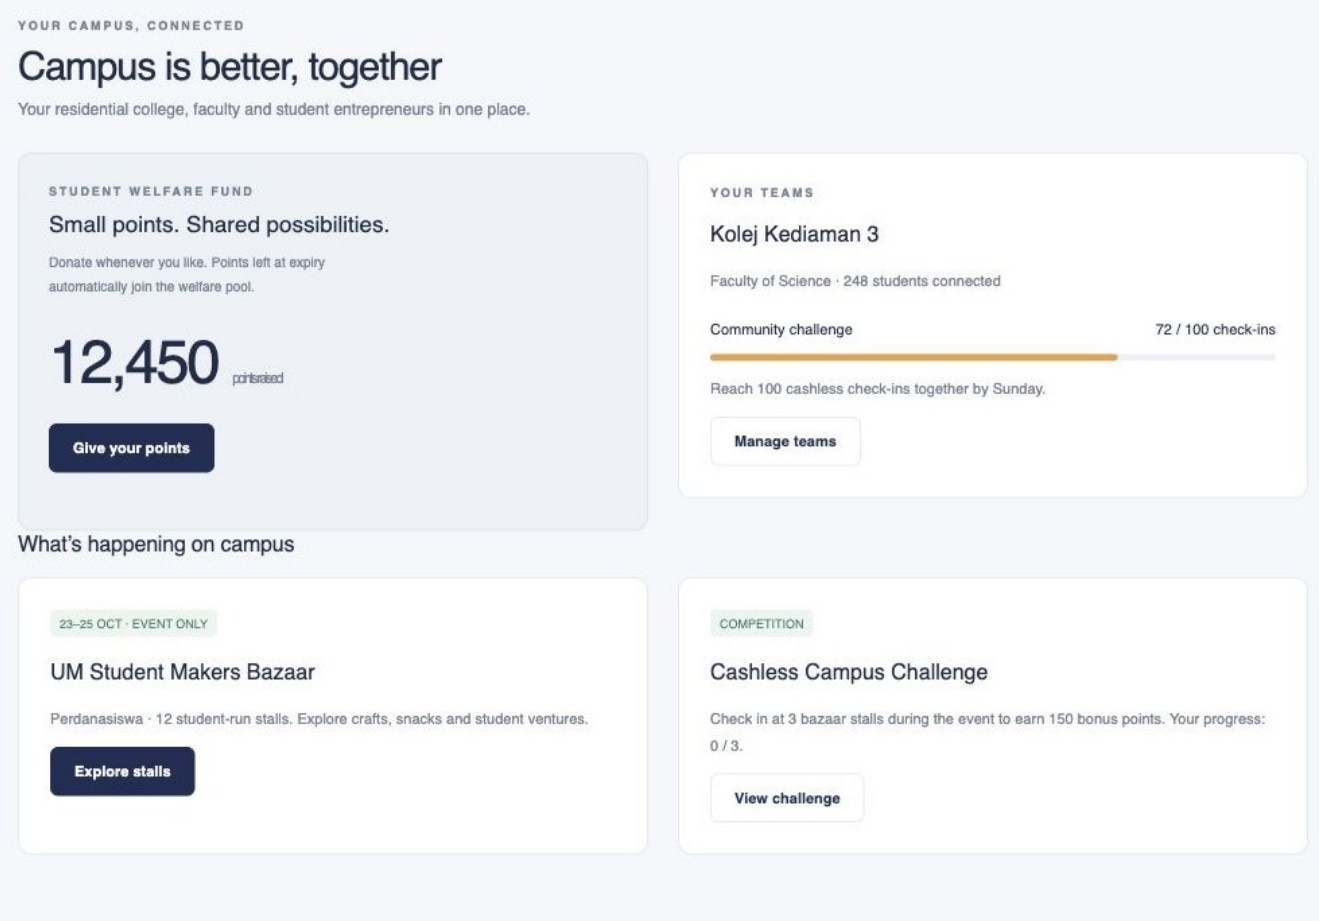

Figure 11 Community activity links personal participation with teams events and proposed welfare contributions.

Profile fields connect a student's identity conceptually with a residential college and faculty. Community features bring together team challenges, student events and a welfare-point pool. A direct demonstration donation deducts points and increases the displayed local contribution total.

The intended value is shared participation and visibility for student initiatives. Temporary entrepreneurs and event challenges extend the campus commerce proposition beyond permanent cafés. A live model needs clear ownership of event information and any associated benefits.

UM authentication, verified team membership, live team totals and automatic welfare conversion are not implemented. Any welfare benefit requires agreed funding, conversion rules and accountability; a point donation in the demonstrator does not transfer money to an organisation.

Merchants join a coordinated campus network

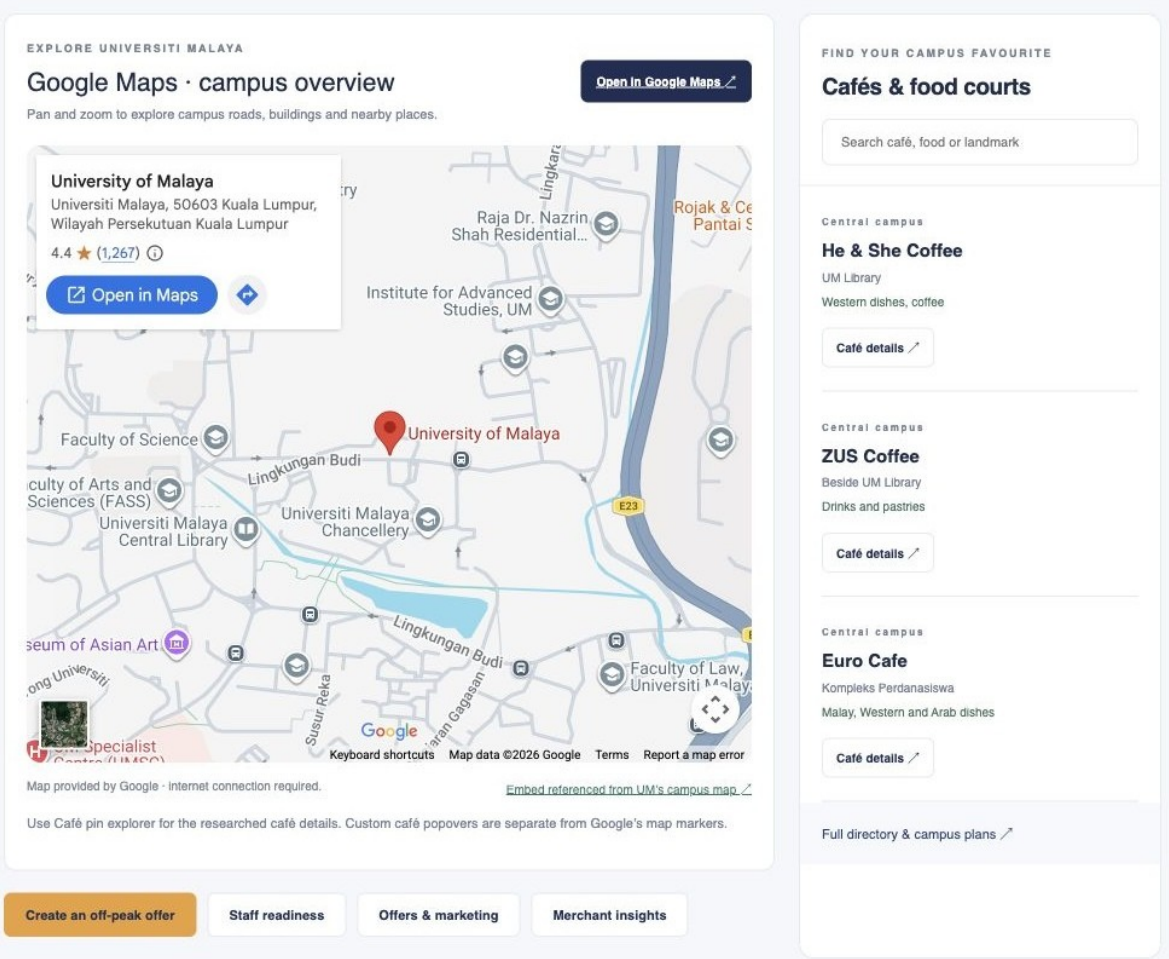

Figure 12 The merchant overview connects campus visibility with business actions.

Merchants are the supply-side participants in the programme. The proposed experience combines discovery visibility, baseline assessment, business onboarding, staff readiness, promotions and participation insights. The map-based overview provides campus context beside the business workflow.

The intended benefit is a clearer route into a coordinated initiative and better support for different starting capabilities. Merchants remain responsible for accurate recipient and business details, independent payment confirmation, current information and honouring approved incentive terms.

Onboarding and assisted merchant support

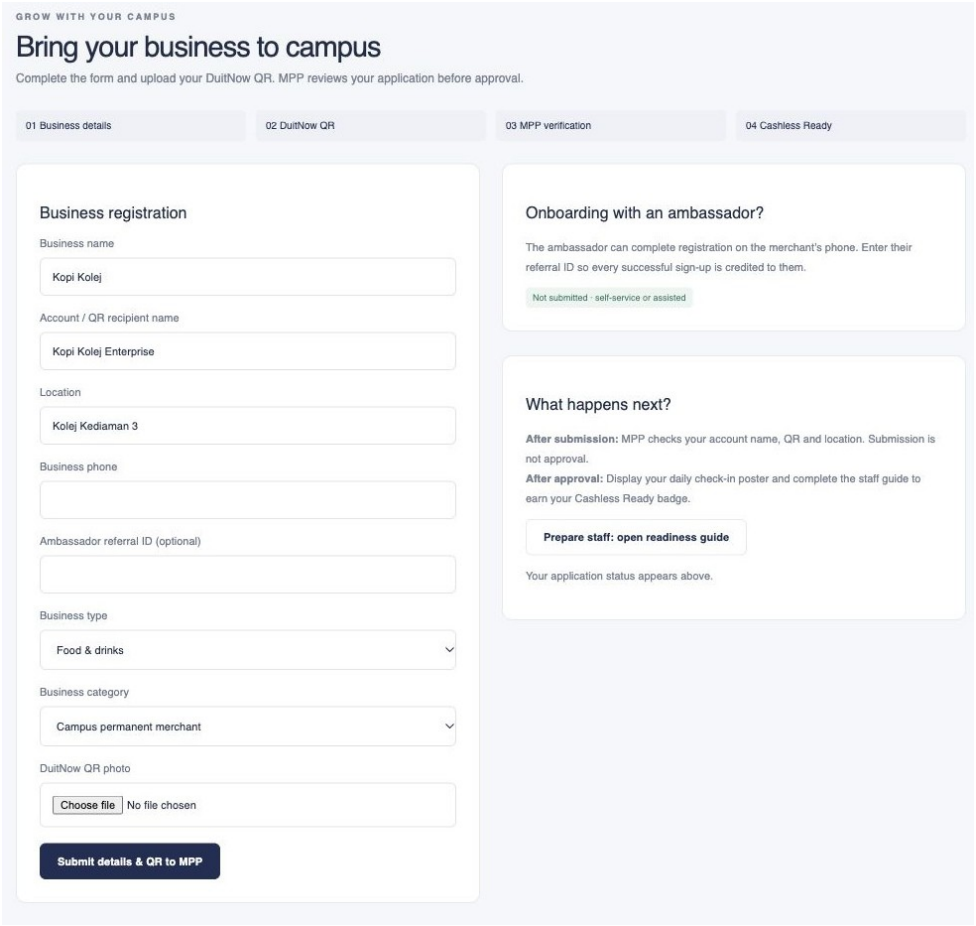

Figure 13 Business details and an optional ambassador identifier support the proposed onboarding process.

The merchant baseline covers financial scenarios and operational readiness, including business QR availability, staff confirmation ability and settlement-record confidence. Its support recommendation directs a merchant toward onboarding or staff preparation. A Grade A label is a support segment and does not replace business review.

Business onboarding captures the business and recipient names, contact, location, type and category. An optional ambassador identifier recognises the proposed assisted route. A submission adds the business name to the local MPP review queue.

The selected QR image is not uploaded or retained, and review evidence remains placeholder content. The live proposition needs a verified link between business ownership, payment recipient, source documents and the review decision. Ambassador credit is conceptual; no separate attribution ledger exists.

Staff readiness supports reliable acceptance

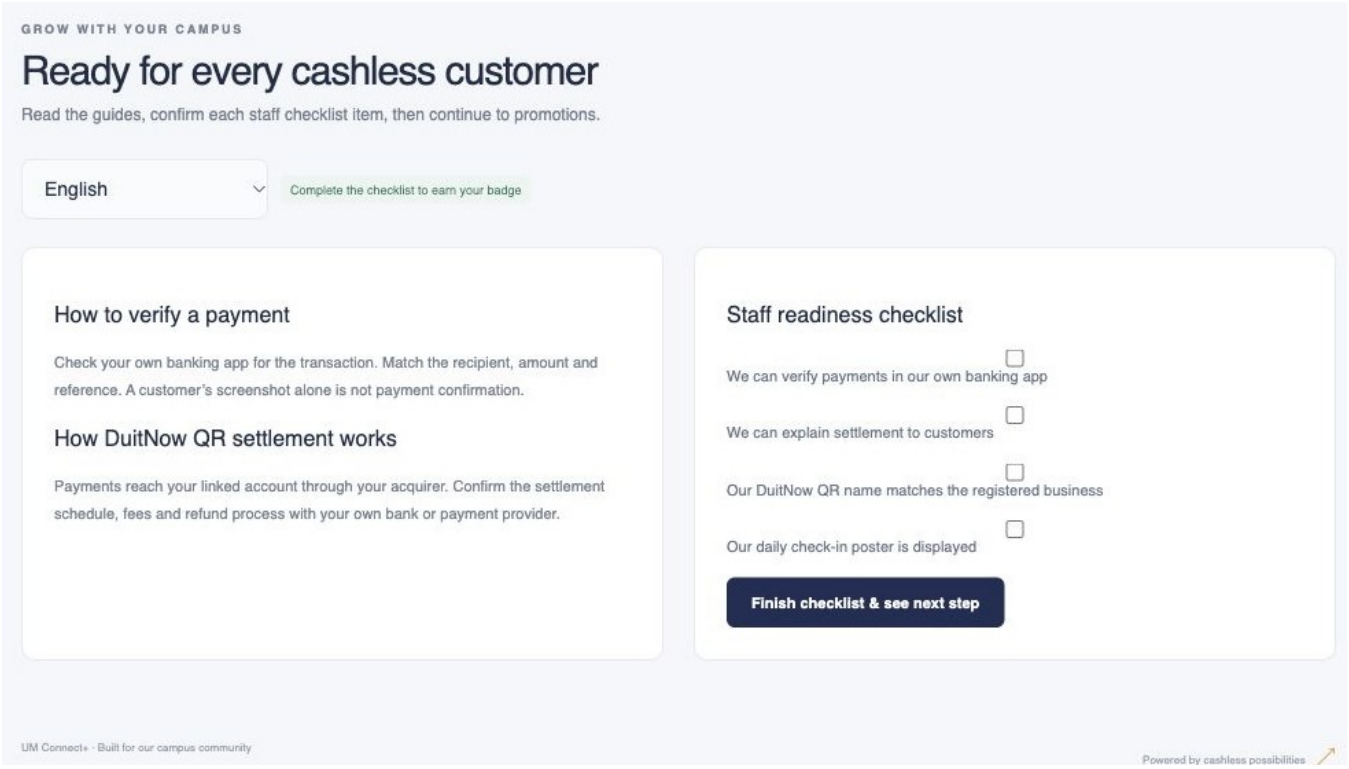

Figure 14 Readiness content addresses payment confirmation and settlement in three languages.

The readiness area provides English, Bahasa Malaysia and Chinese explanations of independent payment confirmation and settlement. A checklist covers staff ability to confirm payment, understand settlement, match the QR recipient with the business and display a participation poster.

The programme value is fewer operational uncertainties at the point of sale, especially for merchants needing assisted onboarding. Staff preparation and MPP business verification are separate responsibilities; one does not automatically establish the other.

The current poster illustrates a typed daily check-in code and a QR-like symbol. A production programme would need a reliable participation method, appropriate poster generation and a defined approach to staff turnover and refresher support. Readiness completion in the demonstrator stores a local flag rather than proving competence across all staff.

Merchant promotions follow an approval model

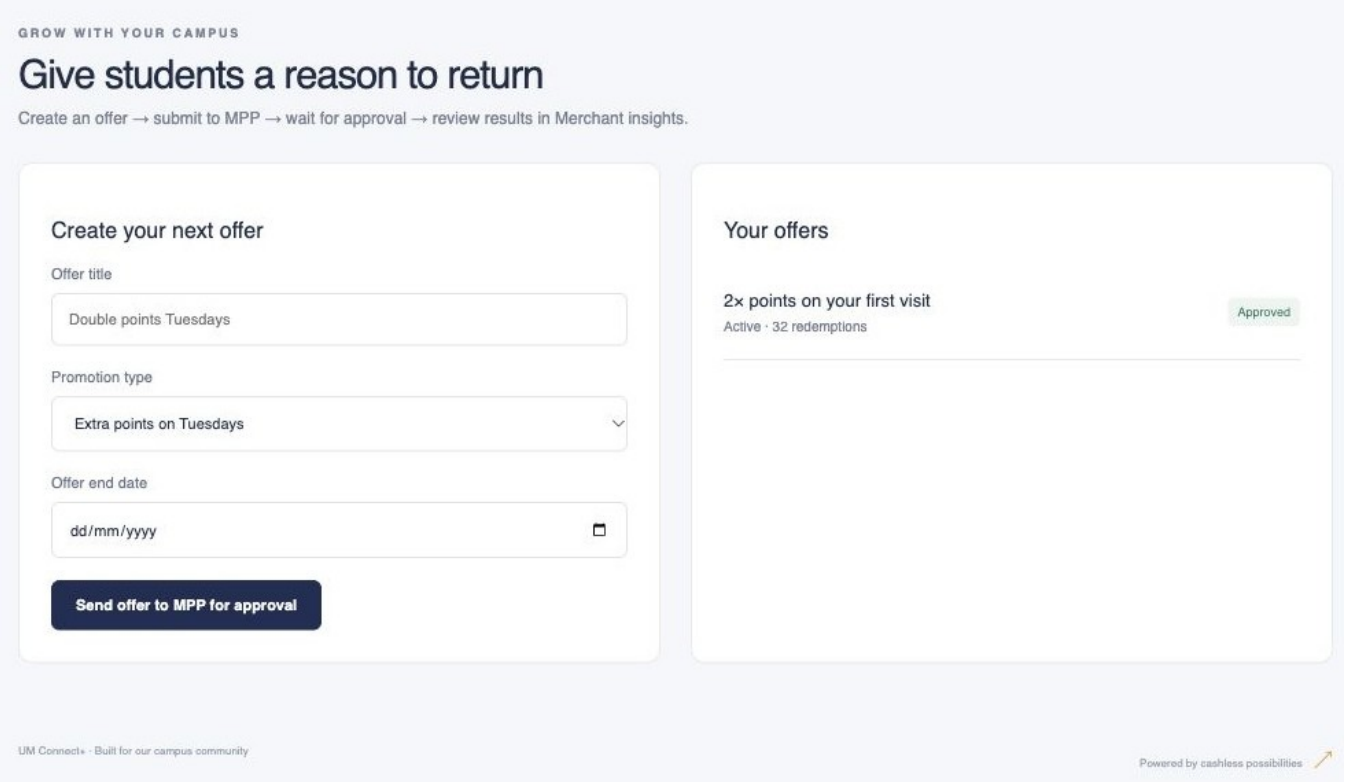

Figure 15 A promotion proposal remains pending until MPP review.

Merchants can propose an offer title, type and end date. The workflow separates an incentive proposal from approval, giving MPP a defined opportunity to assess purpose, clarity, funding and terms. Standard promotions appear in Campaign manager for review.

The intended benefit is relevant promotion under programme oversight. Examples include extra points, first-visit benefits and vouchers. The merchant can see the proposal status, while the student-facing experience can communicate the approved message.

Current approvals change local status and a sample merchant message. Standard promotion scheduling, expiry, multiplier calculations, rejection reasons and full liability allocation are not implemented. Approval to pilot should therefore distinguish the presentation of a promotion from a funded and enforceable offer.

Off peak offers target spare café capacity

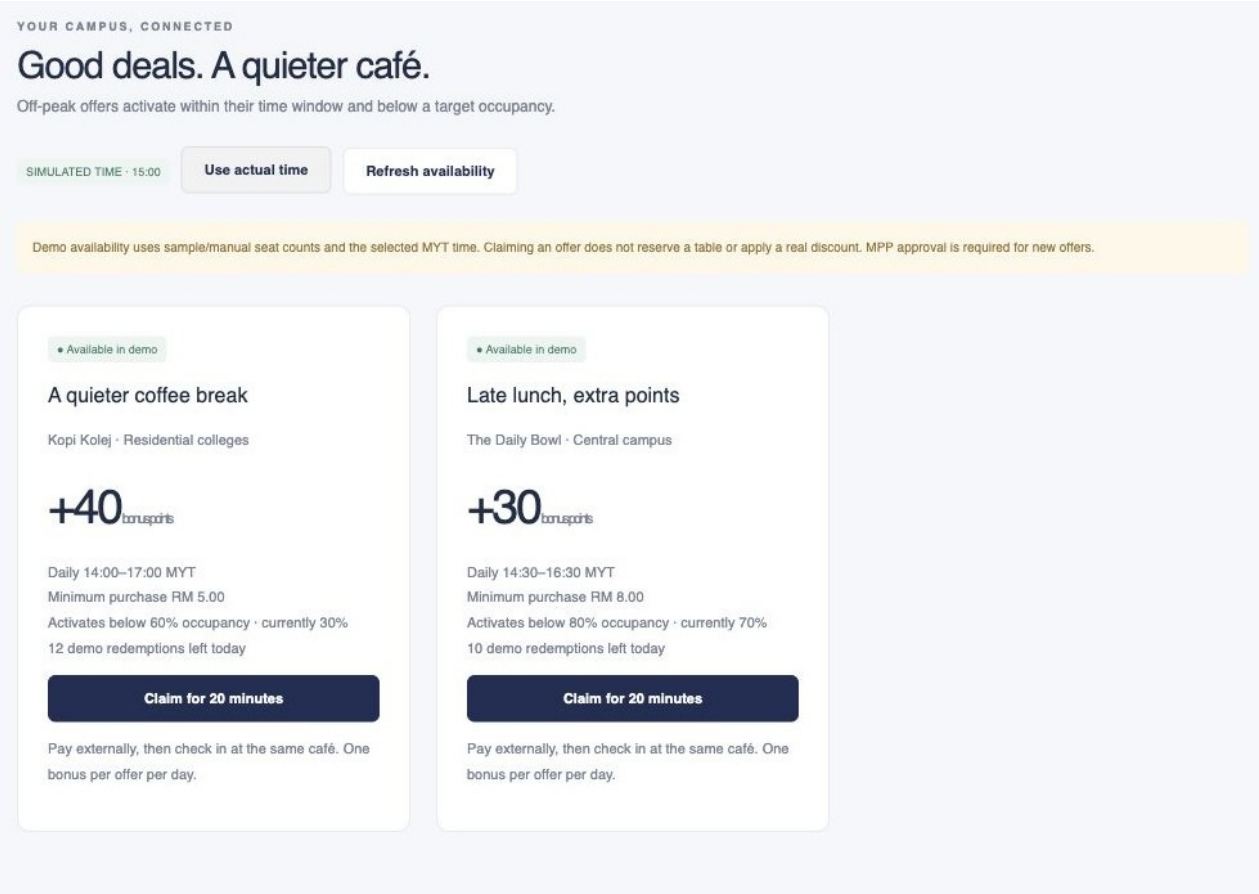

Figure 16 Student offer cards communicate hours minimum spend occupancy and allocation conditions.

The merchant defines a time window, occupancy threshold, bonus points, minimum spend and daily redemption allocation. MPP approval precedes availability. Manual seat counts provide the demonstrator's utilisation input; an approved offer is available only while its time, occupancy, pause and allocation conditions also hold.

A student claim lasts 20 minutes, with eligibility checked again when recording the purchase. The correct café, minimum spend and daily-use restriction apply. If a condition changes, base points can still apply without the off-peak bonus. A claim neither reserves a seat nor applies a real price reduction.

Intended benefit. Students gain an incentive for a quieter visit, merchants gain a way to attract activity during spare capacity, and MPP can review reward affordability. The screenshot uses a labelled simulated time; neither manual counts nor local redemptions demonstrate real occupancy uplift.

Merchant insight and student entrepreneurship

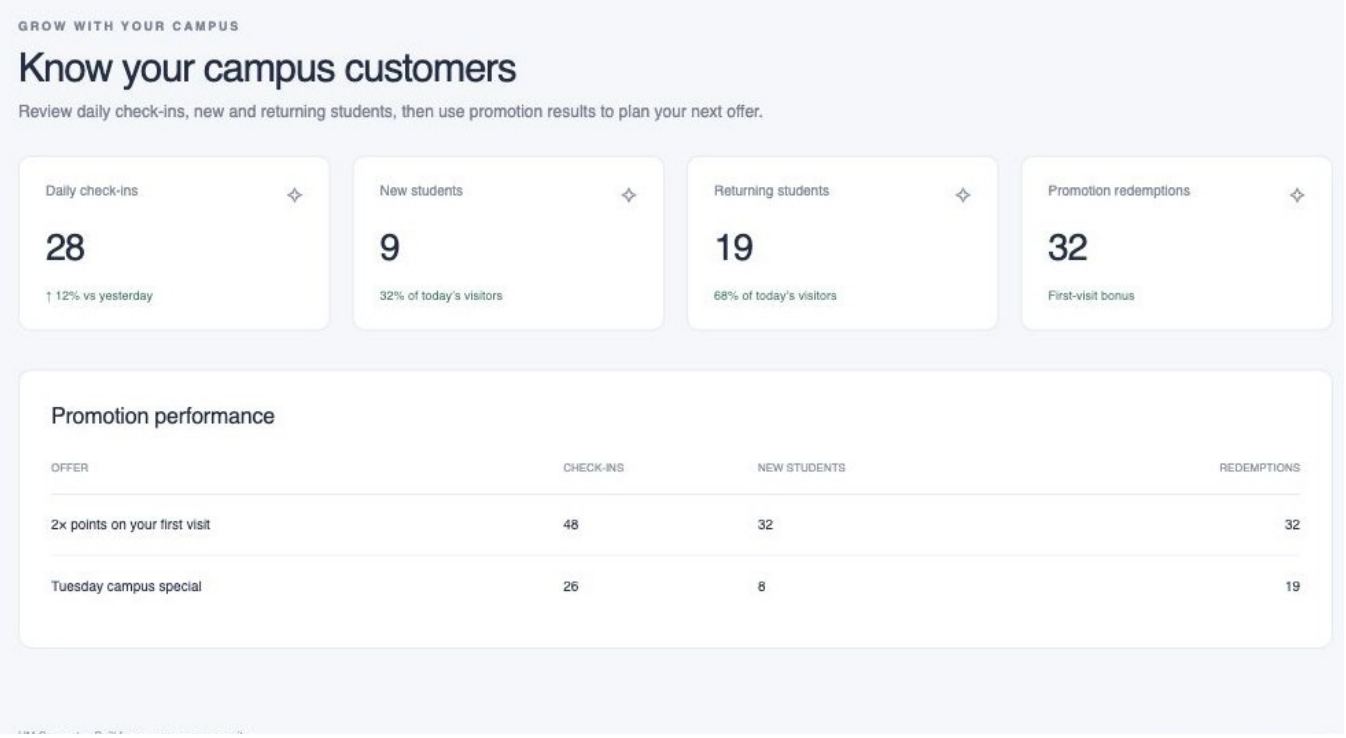

Figure 17 The proposed merchant measures include check-ins new and returning students and promotion use.

Merchant insights illustrate the reporting needed to refine offers: daily participation, new versus returning students and promotion redemptions. These measures are relevant to retention, but the current figures are seeded examples rather than live business analytics.

Student bazaars extend the participation model to temporary entrepreneurs. The interface presents business and event details with QR selection, while the current demonstrator retains only a stall name for the local MPP queue. Event expiry, event-only challenges and retained event evidence still need implementation.

Governance significance. Permanent and temporary businesses need appropriate eligibility, reporting periods and ownership of updates. Success should be evaluated through incremental participation and manageable merchant effort rather than promotional redemption counts alone.

MPP coordinates the programme centrally

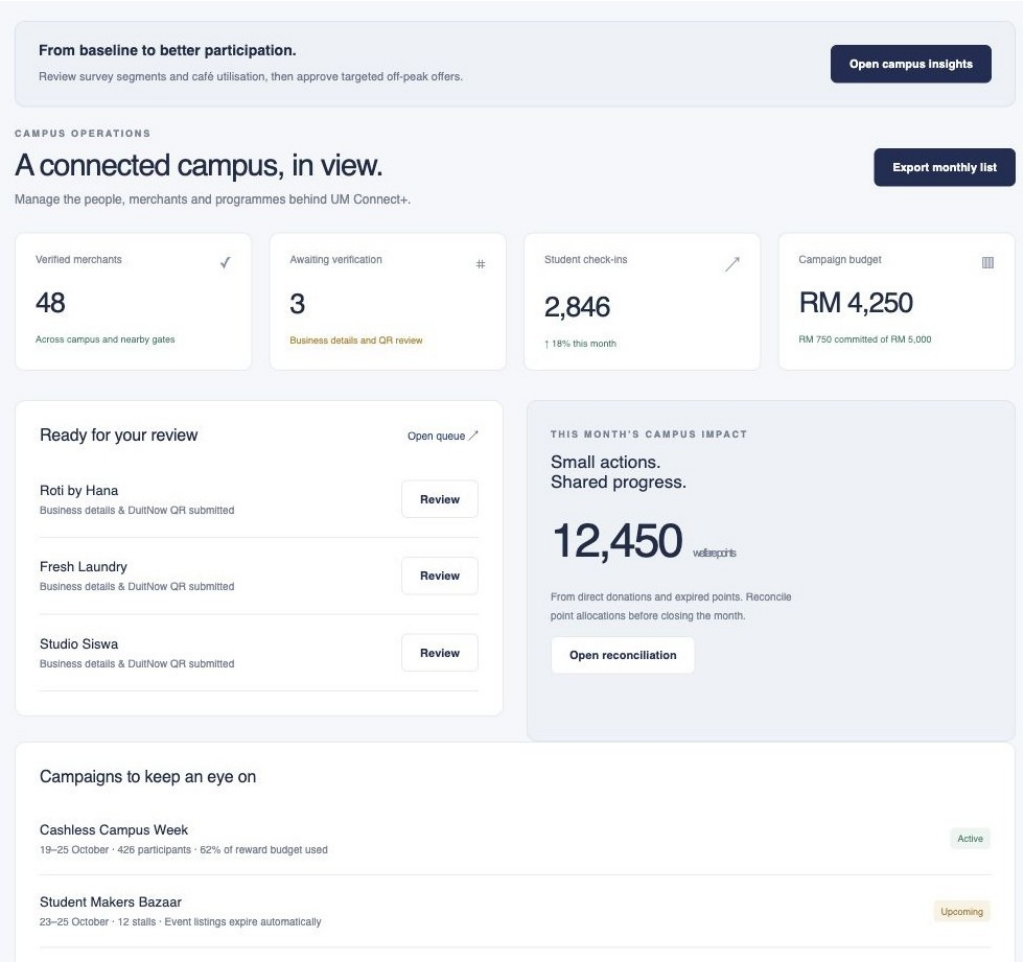

Figure 18 The MPP web dashboard brings programme review and coordination into one view.

MPP has a separate website for programme coordination. The overview groups merchant review, student participation, campaigns, welfare activity and budget concepts, with links into the relevant operational areas. This makes the proposed review role visible and connects activities otherwise spread across forms and spreadsheets.

The coordinating benefit depends on reliable source records and identifiable decisions. Headline totals in the current dashboard combine sample values with limited local changes and must not be treated as programme results. The live dashboard should present reconciled information with clear period, source and status definitions.

Survey segments inform support allocation

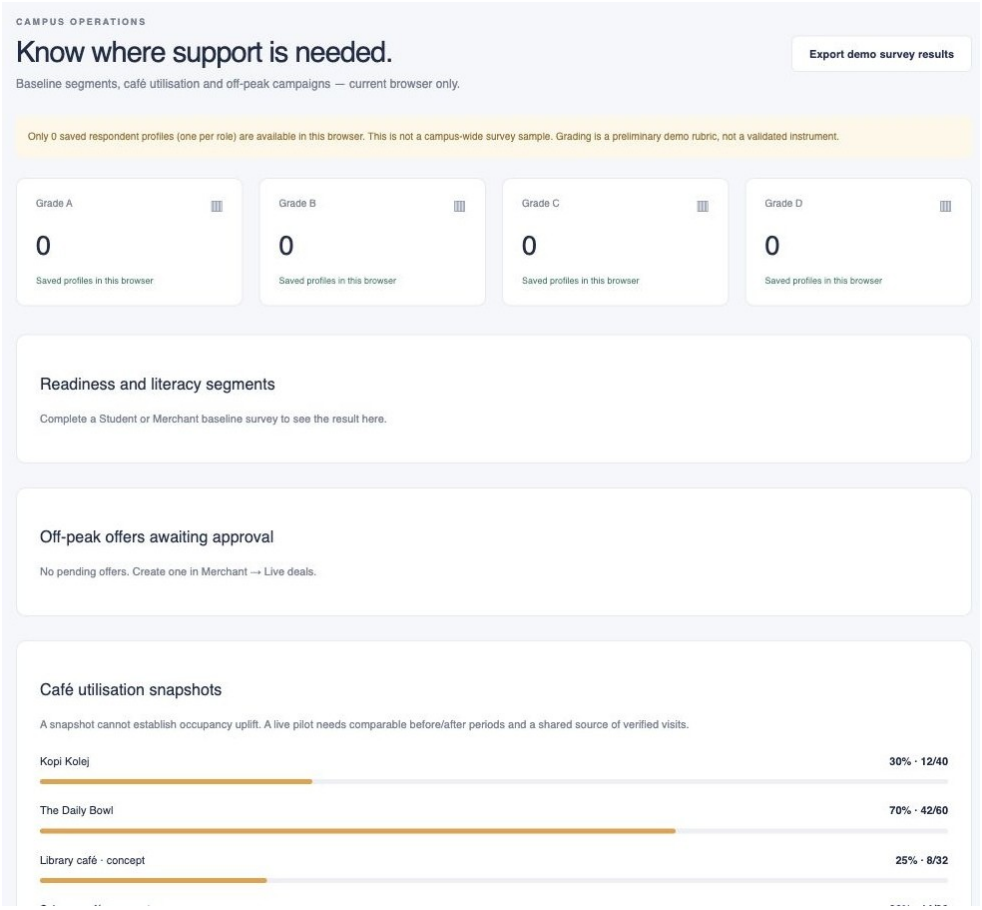

Figure 19 MPP can consider saved baseline profiles alongside sample utilisation and off peak proposals.

Survey & café insights presents component scores, combined grades and suggested support for saved student and merchant profiles. It also brings together manual occupancy snapshots, pending off-peak offers and locally recorded off-peak reward use. A CSV provides a route to further review of the saved survey records.

The intended value is better targeted support and a common view of the starting population. A validated assessment and shared data service would allow programme operators to identify groups requiring assistance and assess whether interventions improve readiness or knowledge.

Only one current profile per role exists in this browser, so displayed counts cannot estimate financial literacy across UM. A single occupancy snapshot cannot demonstrate improvement. A live pilot needs a defined sample, consistent measures and comparable periods.

Verification establishes programme eligibility

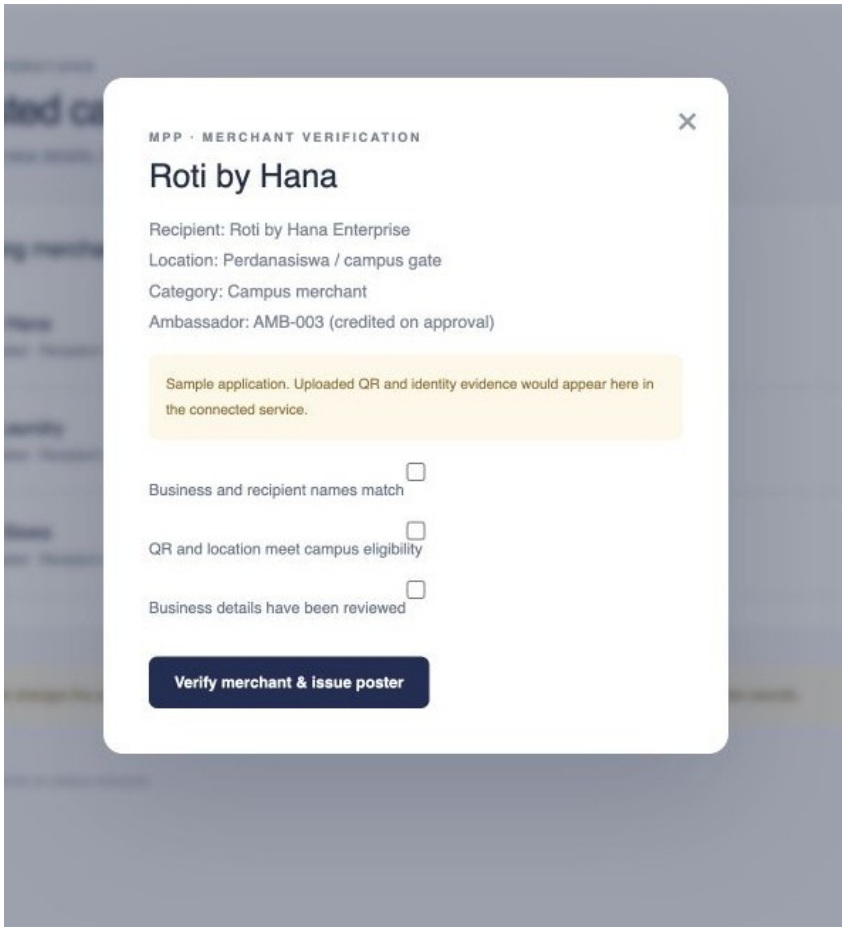

Figure 20 The review concept separates business and recipient consistency from readiness support.

The verification queue brings together sample applicants and locally submitted business or stall names. Its review checklist addresses recipient and business consistency, campus eligibility and business details. An approval changes the local status and illustrates the point at which programme eligibility would be established.

A live review should be attributable to an authorised reviewer and supported by retained evidence, clear criteria and a recorded decision. There should be a way to seek corrections, manage conflicts and explain a rejection. These are proposed control requirements rather than completed services in the demonstrator.

The current evidence dialog contains placeholders. It does not inspect a stored upload, validate a real QR or connect a bank account. A readiness grade, selected QR file or applicant name alone cannot establish eligibility.

Campaign oversight connects intent with terms

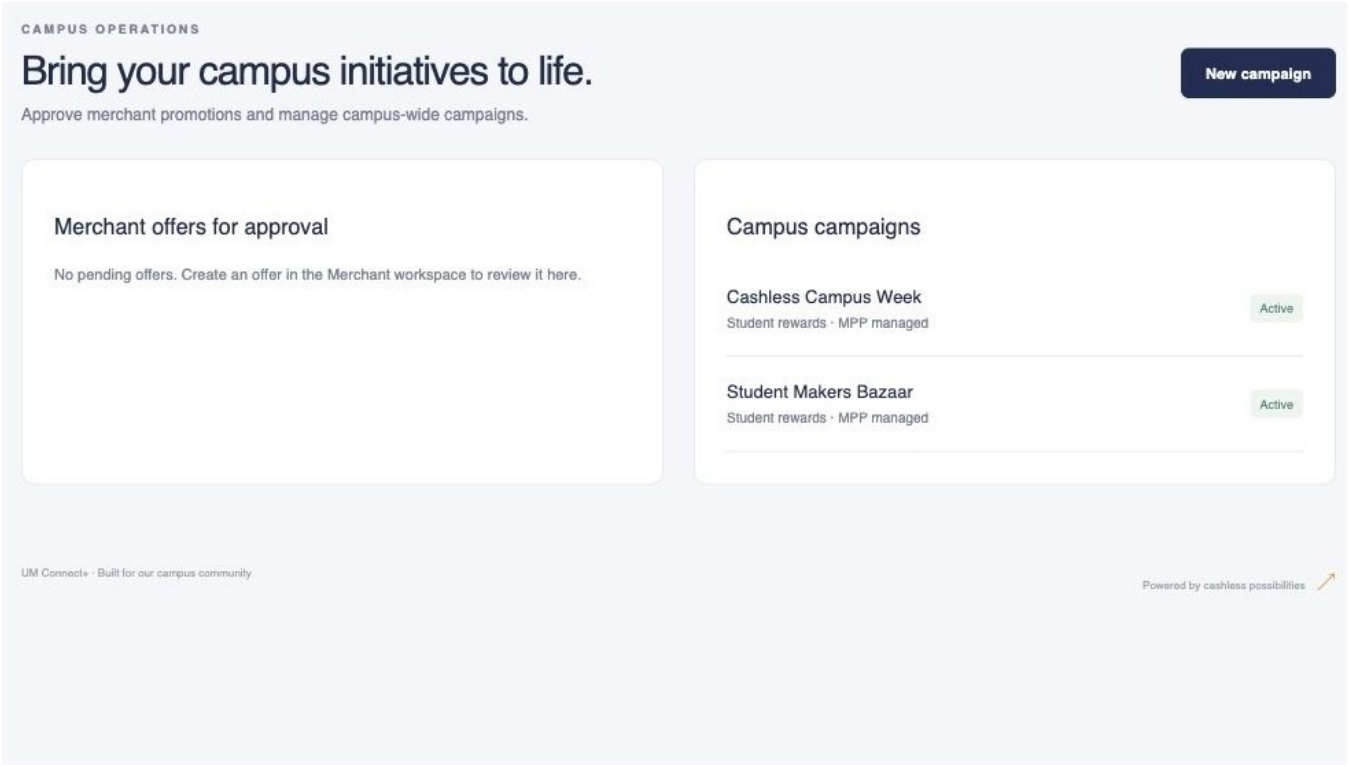

Figure 21 Standard promotions and campus campaigns are presented for MPP coordination.

Campaign manager supports the concept of reviewing merchant proposals and coordinating campus-wide initiatives. Standard promotions are considered here; conditional off-peak offers are reviewed in Survey & café insights. This separation makes the different operating conditions visible.

Governance should connect each approval to a stated purpose, defined participant terms, funding and decision ownership. For a live programme, campaign versions and dates should determine which conditions govern a participation event, with the ability to pause or withdraw an offer appropriately.

The current campus-campaign creation retains the name but not its entered dates. Standard approvals update local status and a sample student message. Scheduling, complete budgets and formal decision histories remain development requirements.

Budget visibility and configurable rewards

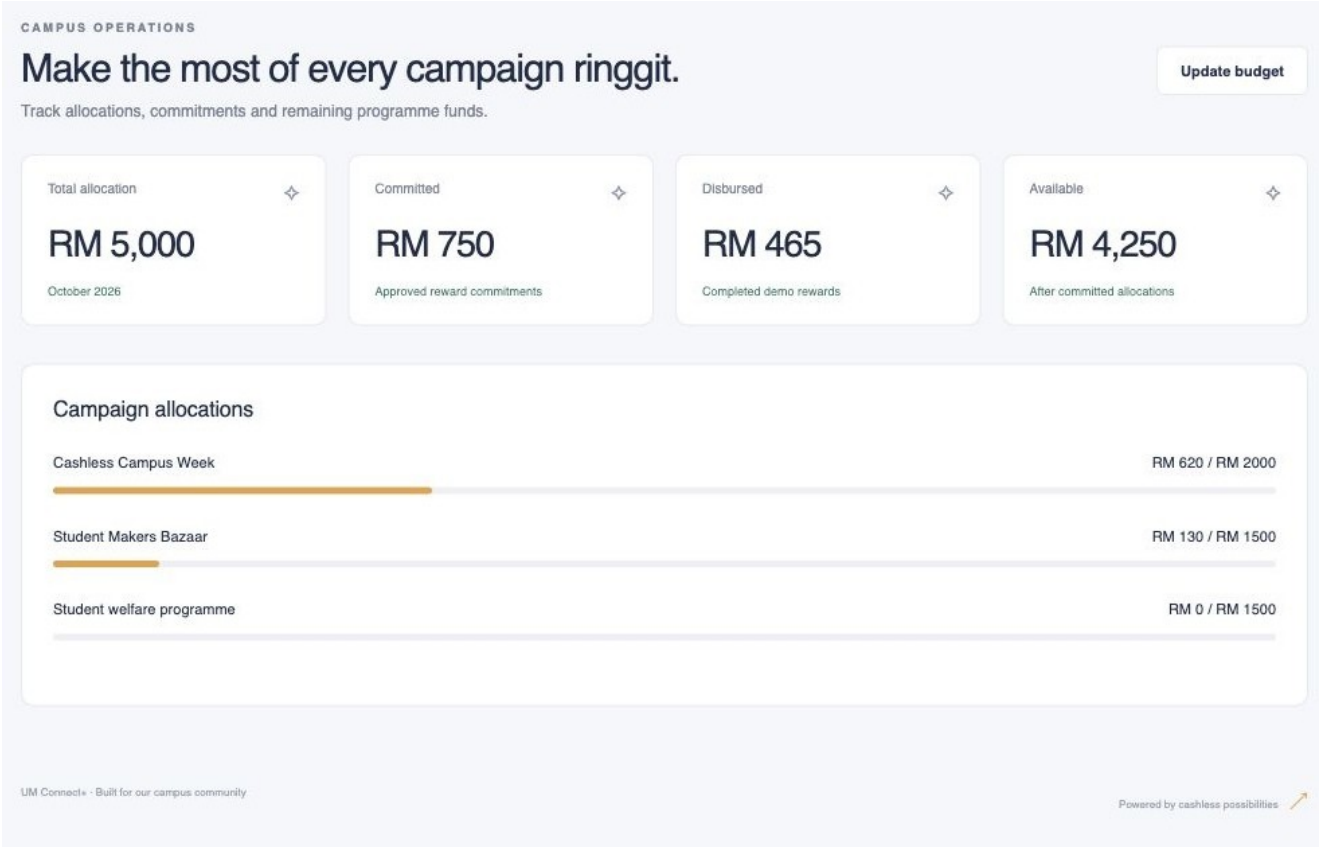

Figure 22 The budget concept groups allocation commitments disbursement and available funds.

Budget tracker makes programme funding visible through allocation, commitments, disbursements and an available-funds calculation. Points configuration separately supports adjustments to future base earning, first survey rewards, referral values and the monthly referral cap. Off-peak bonuses and daily limits are set per offer and reviewed by MPP.

These capabilities allow governance to discuss affordability and change future incentive terms transparently. Historical awards are not recalculated when a configured rate changes. A real scheme requires an auditable relationship between the approved rules, qualifying event and issued benefit.

The sample commitments and campaign allocations are not a live liability calculation. A budget total does not itself fund or fulfil rewards. Governance approval should cover the funding source, responsible owner, limits, redemption settlement and treatment of unused or disputed benefits.

Reconciliation and reporting close the cycle

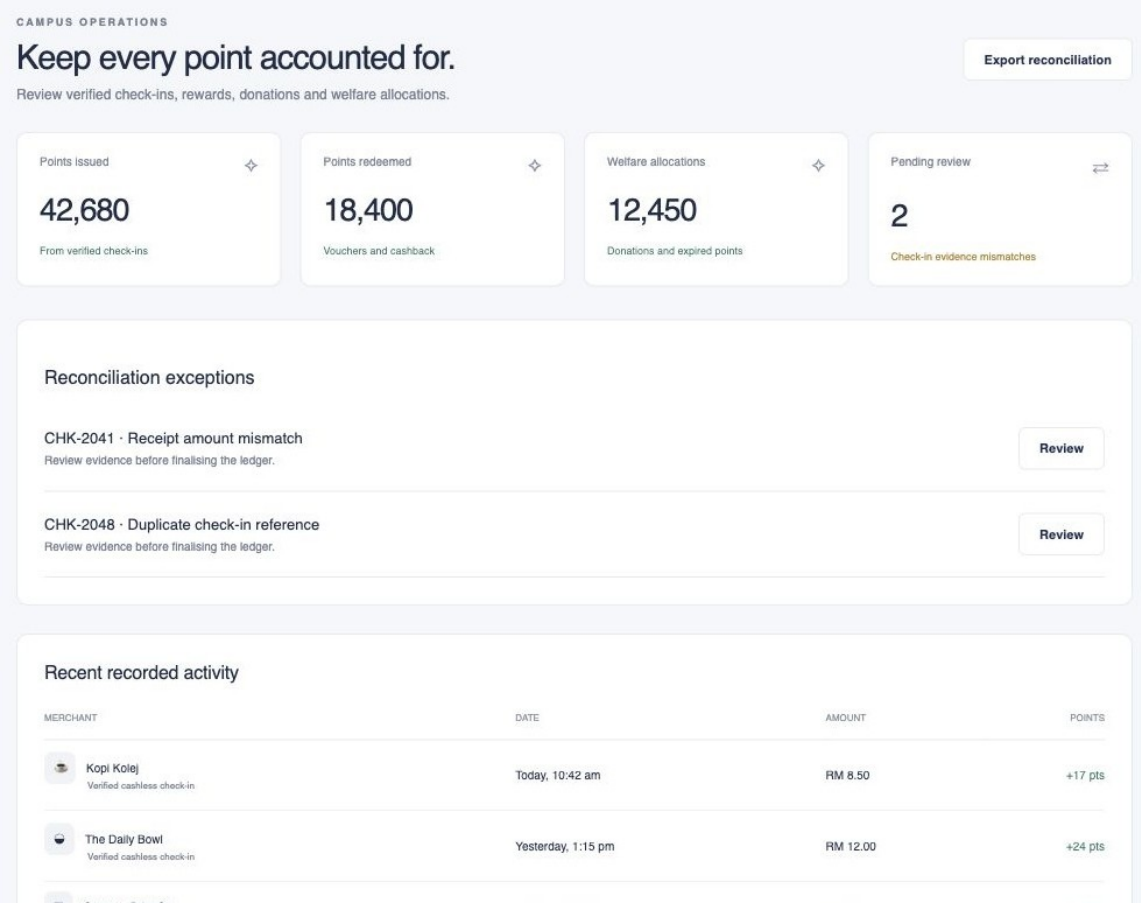

Figure 23 Sample exception review and programme records illustrate reconciliation responsibilities.

Reconciliation illustrates issued and redeemed points, welfare allocations and exceptions such as an amount mismatch or duplicate reference. The intended role is to establish record quality before period closure and reporting. Current correction actions change local status rather than amend a transactional ledger or validate evidence.

The PayNet merchant-list export provides a CSV concept with merchant, account, category, location, demo QR identifier, event expiry and ambassador fields. Survey and reconciliation exports provide additional review outputs. October 2026 and several fields are fixed examples.

A live programme needs agreed reporting definitions and schemas, reconciled source records and an audit trail for adjustments. The current export is not an authenticated PayNet submission or a verified register; seeded merchants and locally approved names use placeholder fields.

An illustrative incentive model

The following values describe adjustable demonstration rules. They support a discussion of qualification and affordability; they are not a funded participant offer.

Event	Example rule	Qualification concept
Purchase record	2 points per RM rounded down per event	External payment followed by an eligible programme record
First student baseline	50 points	Once regardless of grade
Qualified referral	100 points to referrer and 100 to invited friend	First eligible participation event and a default five monthly cap
Learning	50 points per lesson	First correct completion
Off-peak visit	40 points in the seeded Kopi offer	Approved offer and all claim purchase and availability conditions
Example redemption	500 points for a RM5 voucher	Illustrative cost and voucher with no monetary entitlement

Illustrative combined visit

A seeded balance of 1,250 becomes 1,300 after the first baseline. A qualifying RM10 purchase can add 20 base points, 100 invited-friend points and a 40-point off-peak bonus, resulting in 1,460. This example assumes each distinct condition is met and does not add a separate referrer simulation award.

Funding and fairness

The live scheme should define who can earn, how often, on which evidence and within which limits. Evaluate whether rewards encourage useful participation without unnecessary spending, exclude students with lower digital confidence or shift costs to merchants. Referral abuse, duplicate records and unfunded liabilities require shared controls rather than browser-local checks.

Data architecture and readiness boundaries

The current site is a static demonstrator hosted on GitHub Pages. JavaScript supports forms, rules and downloads; browser storage holds local profiles and activity. The student PWA adds scoped caching and access convenience. These are useful foundations for experience validation, but shared operational services remain necessary.

Area	Current demonstrator	Required for live reliance
Identity	Role experiences and locally stored profile fields	Verified student and merchant accounts with restricted MPP access
Records	Browser-local state and seeded figures	Durable shared records with event identifiers and accountable changes
Purchase evidence	Typed code or file selection with no retained upload	Agreed reliable qualification evidence duplicate checks and secure handling
Rewards	Local calculations sample vouchers and exports	Funded liabilities fulfilment and an auditable ledger
Maps and directory	Google context and publicly sourced listings	Verified venue information freshness and responsible owners
Offline access	Cached student assets after an online visit	Clear continuity boundaries and tested behaviour on target devices

Data responsibility

Governance should agree the minimum fields, purpose, participant notice, access, retention and deletion arrangements. Responsibility is also needed for directory corrections, reward disputes and support. No cross-device synchronisation, payment confirmation or server-side referral ownership service has been added.

Evidence selected in the interface is not uploaded or retained. Student PWA caching excludes Google services and MPP pages. Public directory records are separate from the fictional and concept cafés used for controllable occupancy and incentive demonstrations.

A bounded pilot before expansion

Proposed scope

A pilot should begin with a defined student cohort, a verified subset of merchants, a fixed period and an agreed reward envelope. Programme owners should confirm inclusion, merchant obligations, support capacity and evaluation definitions before activation. No participant target, cost commitment or delivery date is assumed in this proposal.

Stage	Purpose	Evidence for the next decision
Confirm scope	Agree sponsor operating owner cohort merchants funding and evaluation.	A documented pilot proposition and named accountability.
Establish readiness	Validate directory and survey and implement identity shared records evidence and rewards.	End to end testing secure access reconciled calculations and target-device verification.
Run controlled pilot	Observe participation support demand exceptions and cost against a baseline.	Comparable period data and reliable qualification and liability records.
Review and decide	Assess usefulness inclusion merchant effort and affordability.	An explicit decision to refine continue expand or stop.

Dependency on partners

Payment providers remain responsible for payment processing. Any bank, payment-network, merchant or welfare partnership requires separate confirmation of responsibilities, data and reporting expectations. Interface wording does not constitute an agreement or endorsement.

Delivery ownership

The programme sponsor owns the decision to proceed; an accountable operating owner coordinates implementation. Technology, finance, data stewardship, support and MPP review responsibilities should be named before the readiness decision. The pilot should not depend on informal ownership of critical exceptions or reward commitments.

Evaluation and governance oversight

Outcome	Proposed measure	Governance interpretation
Student value	First-to-second qualified visit rate reward use and validated knowledge change.	Does participation provide useful return behaviour or learning rather than sign-ups alone?
Merchant value	Verified onboarding completion off-peak qualified visits and returning-student share.	Does activity improve relative to comparable periods at manageable effort?
Programme quality	Evidence exceptions duplicate rate dispute resolution and record completeness.	Can reported activity and rewards be trusted and reconciled?
Affordability	Cost per qualifying return visit and liability against funded budget.	Are benefits sustainable and within approved commitments?
Inclusion	Participation and support needs across readiness groups and device access.	Are less confident participants able to benefit?

Evaluation design

Comparable cafés, cohorts and trading periods are necessary to distinguish incentive effects from normal traffic changes. Programme check-ins should remain distinguishable from independently verified purchases. A single occupancy snapshot, seeded total or redemption count cannot establish causal impact.

Oversight during the pilot

Governance should receive a concise view of performance, funding, exceptions, participant feedback and material changes to rules. Identifiable decision ownership and a record of campaign versions support accountability. The decision to expand should be based on evidence of useful outcomes, equitable participation and sustainable operating cost.

Decisions requested from governance

The recommended decision is to endorse further pilot development within defined conditions, with a separate readiness decision before real rewards and participant records are relied upon.

Decision area	Proposed governance determination
Programme endorsement	Confirm whether the campus discovery readiness and repeat participation objectives merit a bounded pilot.
Ownership	Nominate a sponsor operating owner and accountable leads for MPP finance data technology and support.
Scope and inclusion	Agree the cohort merchant subset pilot period and access and support approach.
Funding and terms	Authorise development of a funded incentive model and merchant obligations without treating current demo rates as commitments.
Readiness evidence	Require verified identity shared records agreed purchase qualification auditable rewards and tested devices before activation.
Evaluation and review	Agree measures comparison approach reporting and the criteria for continuation or expansion.

What endorsement enables

An endorsement would allow the project to resolve operational ownership, validate the assessment and directory, confirm participation and funding arrangements, and prepare a detailed delivery scope. It would not by itself authorise an unrestricted rollout or certify the demonstrator as a live financial service.

Expected decision at pilot review

Continue only if the evidence shows useful student and merchant outcomes, manageable support and exception demand, reliable records and acceptable cost. Refine the rules or scope where necessary. Expansion should follow a documented review rather than the presence of a working interface alone.

Scope references and feature coverage

This proposal reflects the implemented demonstration as at 28 October 2026. Screenshots illustrate features and may contain seeded figures, fictional merchants or simulated-time states. The text distinguishes the programme proposition from the services required for a live pilot.

Coverage

Student capability areas include the Overview, baseline, campus cafés, live deals, merchant discovery, check-in, points and referrals, rewards and missions, spending, learning, community and profile. Merchant capability areas include the Overview, baseline, campus discovery, onboarding, readiness, promotions, off-peak controls, insights and student bazaars. MPP capability areas include the Overview, survey and utilisation insight, verification, campaigns, point configuration, budgets, reconciliation and exports.

Source interpretation

Fourteen public café records support discovery. Current price ranges are not published and hours require venue confirmation. Some source information is from a 2023 campus guide, so current operation must be confirmed before reliance. The schematic explorer does not provide surveyed coordinates; Google supplies its own map and markers.
